SOFTWARE DEVELOPMENT PROCESS

This step involves organizing and structuring the software's content and features.

Once the wireframes and prototypes are approved, the designer focuses on the visual aspect of the system/software.

In this stage, the design files are handed over to the development team.

Once the system passes testing and receives client approval, it is ready for launch.

MAINTENANCE

This includes conducting research, gathering information, and creating a project plan.

Wireframes are visual representations that outline the layout and structure of the software.

Concurrently with the visual design phase, content creation takes place.

Testing includes checking links, forms, loading speed, and overall performance.

After the System is live, ongoing support and maintenance are necessary.
